I.2 SEARCH - SHORT TERM DESIGN

The section name is highlighted

The subsection name is highlighted

For clinical note results, the entire individual clinical note is listed as a result. For example, whether the note had “disease status” written within it once, or several times, the note itself is shown as a single result.

Only the first or latest instance of the search match within a section is highlighted. When the user jumps to that section, all instances of that term (3) are highlighted in the view.

For the non clinical note results, the results reflect whatever view (narrative, tabular, visual) is currently being used for each section of the record.

The order of the results is determined by the lefthand minimap ordering of the sections.
