

# MITRE / FLUX NOTES **TREATMENT OPTIONS v2**

EDWIN CHOI, DANIEL REEVES, JUHAN SONIN, 7.NOV.2018

## Goals

1. Communicates advantages and disadvantages of various treatment options to the patient and clinician.
2. Presentation must be visual, clear, and *accessible*.
3. Data must be relevant and meaningful.
4. The patient should analyze her values and preferences, and NOT analyze data.

## Requirements

1. Data is filtered to patients with matching characteristics along various dimensions such as demographics, medical history, and genetics. The user can ease the criteria for the sample set to allow adequate sample size.
2. Supports varying number of treatment options, from simply defined to complex.
3. Be flexible in terms of types of data supported and shown/selected (survival rate, side effects, cost, etc.).

## Further Considerations and Challenges

1. We must minimize our personal biases when balancing or interpreting metrics.
2. *Do not permit* the patient make a mistake in interpreting raw data! Example: the current plot shows survival time for live and deceased patients. The text gives 60 month survival rate, the goal of the chart. However, the graphical representation shows current survival time, mostly of live patients, which is NOT the same.
2. The different categories will have different amounts of data. It is very difficult to visually compare sparse to dense data, particularly with respect to outliers.

## User Scenarios

### Context

1. Before meeting with a patient, the clinician uses her experience, outside knowledge, and the criteria and metric explorations within the Application to form a set of recommended treatments to discuss. During the appointment, the doctor discusses the patient's values and preferences and identifies the corresponding metrics (5 yr survival rate, 5 yr disease-free rate, etc) that address those values. They then compare treatments.
2. A recently diagnosed patient has done research and is familiar with options before an appointment. During the appointment, the doctor and patient together use the Application to understand how this patient's particular situation fits into what she learned through her research. Which of those treatments no longer make sense and won't be effective for *me*? Which of those side effects are most likely to affect *me*?
3. A progressing patient. He has tried the most common and recommended course, but the disease is still stable or progressing. The oncologist and patient discuss what options remain and how the patients' unique status affects the expected efficacy and outcomes of the different treatments.

### Finding Cohorts

1. The patient is in an undersampled slice due to unique demographics or medical history. The pool of patients that match all criteria is too small. The doctor allows the Application to ease the criteria by removing those that generally have the least impact on treatment.
2. The patient has an involved and unusual treatment history. Again, the default matching pool is too small. The doctor uses her specialist information to identify several criteria that have minimal impact on treatment outcome, so she removes those filters, while retaining those criteria that capture her unsuccessful past treatments.

Each row contains the treatment name and selected metric. Survival rates can be displayed at multiple time points or as a distribution. This view is best for displaying many treatment options, with 2-3 or so different metrics. The user can easily compare a single metric across all treatments. The user is always able to dive deeper into a particular metric, as displayed below for side effects.

survival rates | design A

The user selects between survival rates at various time points or the distribution of all survival times.

Ductal carcinoma of the breast

Each card presents the name of the treatment, the number of patients included in the pool, and a section for each metric. Each metric supports a drilldown (on tap or mouse hover) that gives more details. This view accentuates each treatment as a whole, and helps the user digest all the dimensions of the treatment to form a complete picture.

## Integration of treatment cards with table

In this and the next concept, the Treatment Cards are accessed via selection on the table. Rather than being a separate view, they are treated as way to compare 2 or 3 treatment options or as a way to get a different, deeper view of a particular treatment of interest.

Integration | design A | Selected Card Gallery

Treatments are selected via a selection box and displayed below the table. The user can elect additional data for the cards.
