## MITRE SHR USE CASES JOURNEY MAP v 02

05.OCT.16

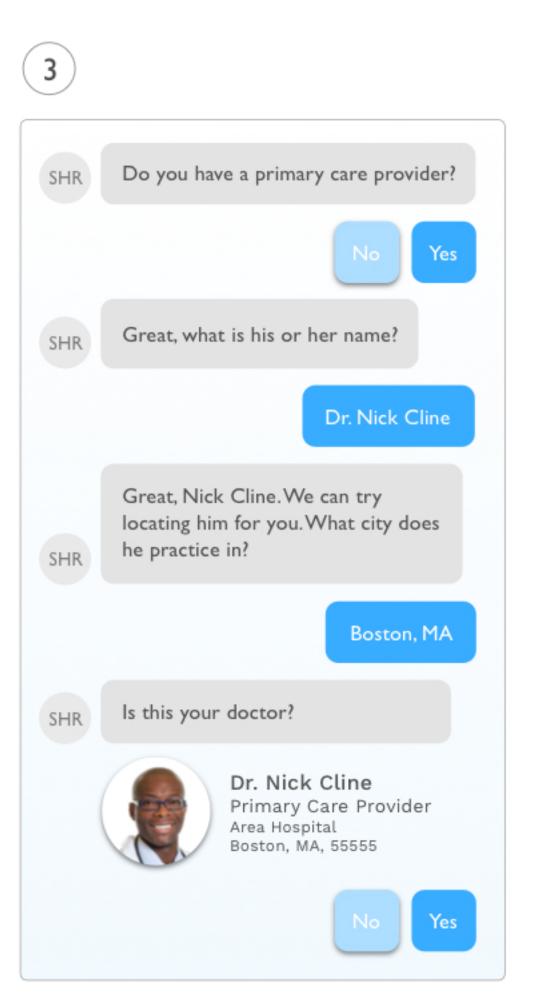

## USE CASE I: Patient opens the SHR for the first time and establishes an ID

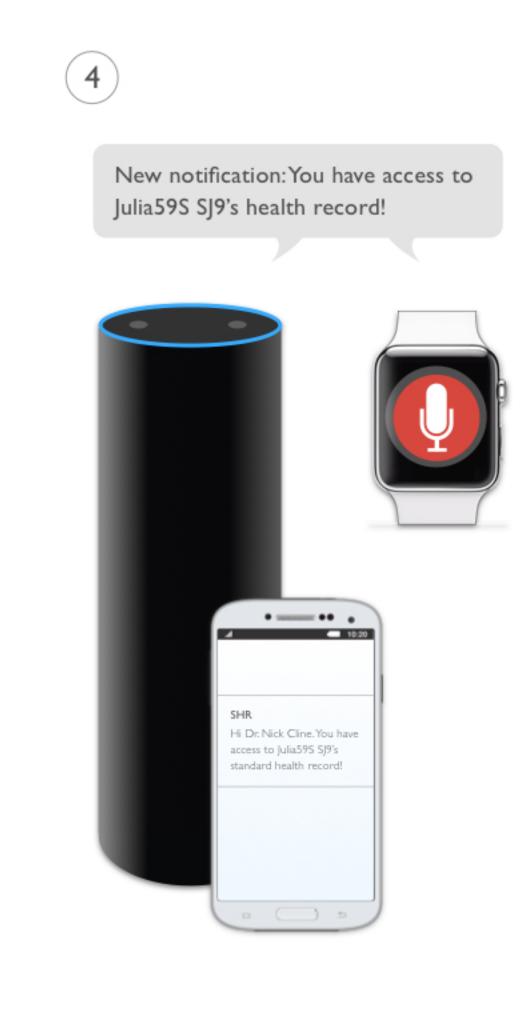

Conversational UI protocol gathers basic patient information

Patient ID information is stored in an HIE, and medical providers are able to access that information at a later time

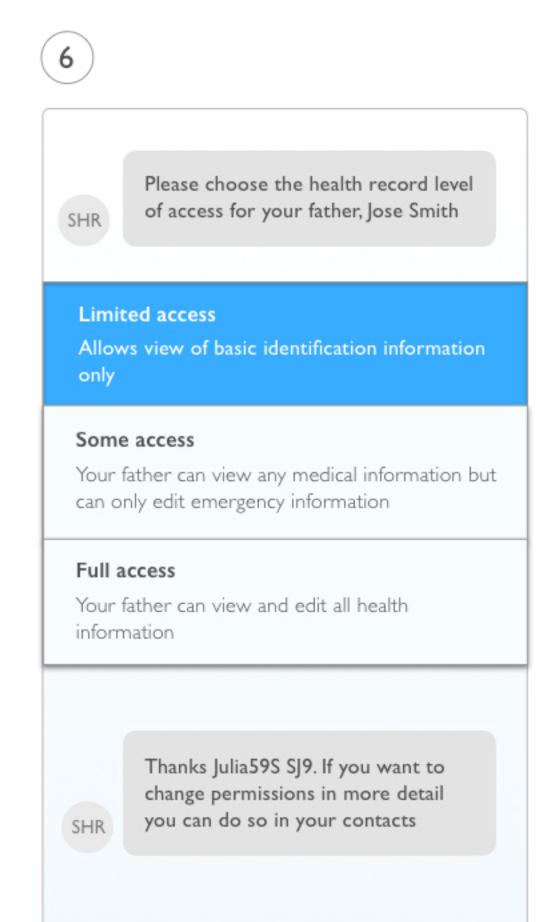

Conversational UI asks the patient for information on their PCP

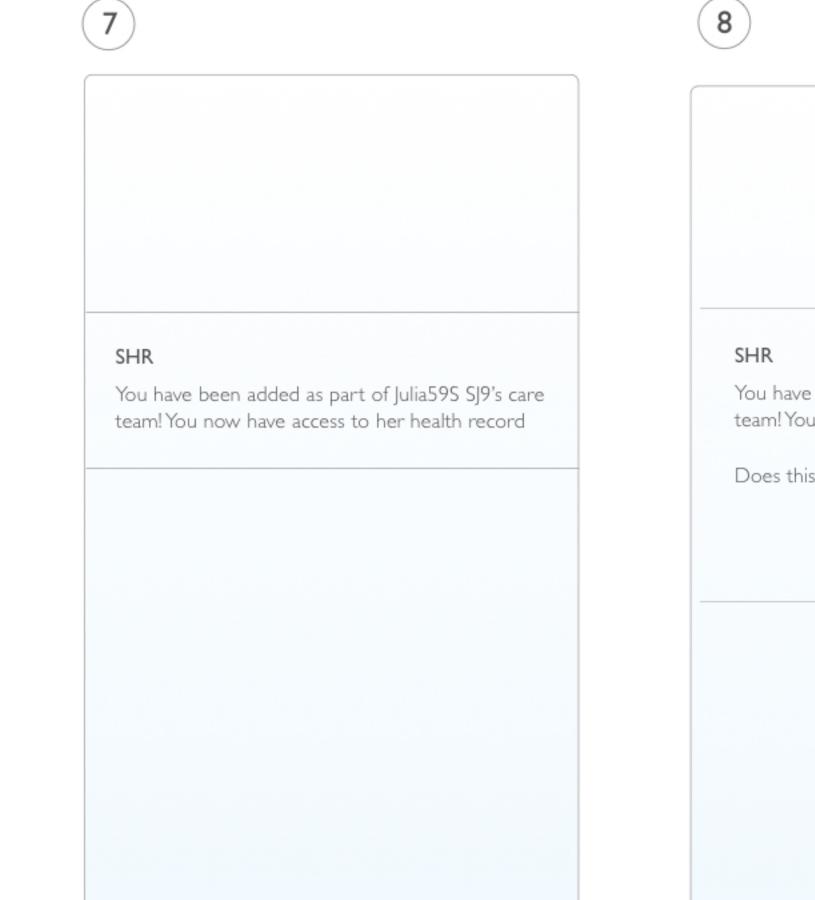

The next time the PCP logs into their HIE, they are notified of their addition to the patients SHR

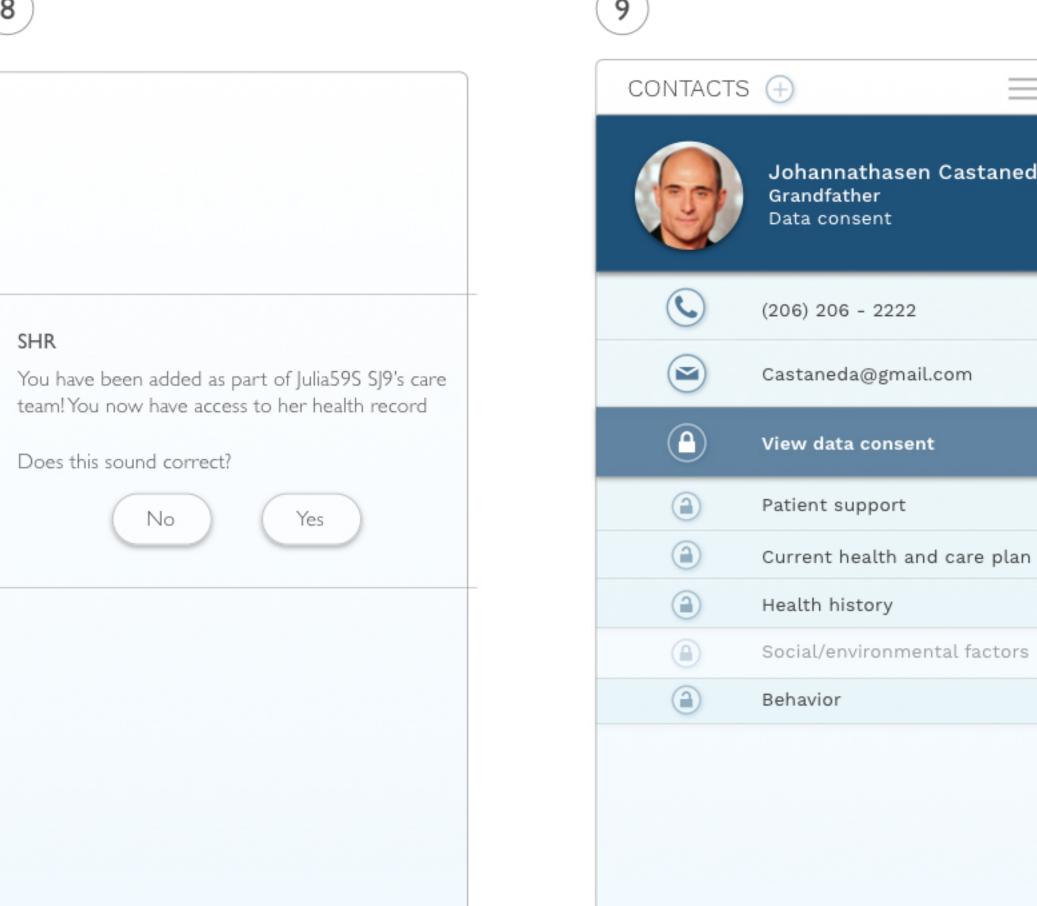

SHR asks the patient for basic information on any care team members they would like to add

SHR permission and consent is specified for each care team member

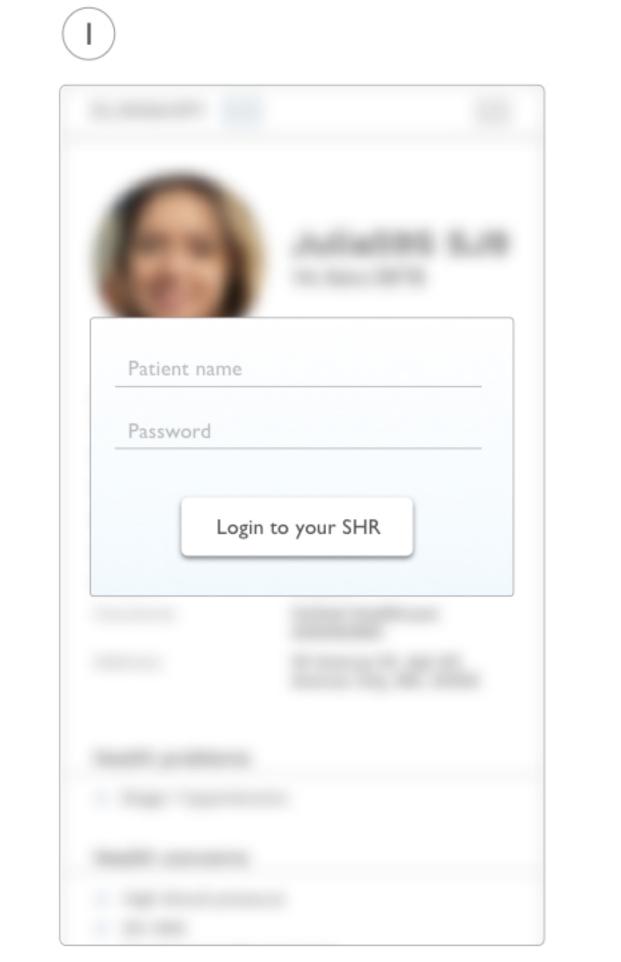

Those members are notified via text/phone that they have ben added as care team members

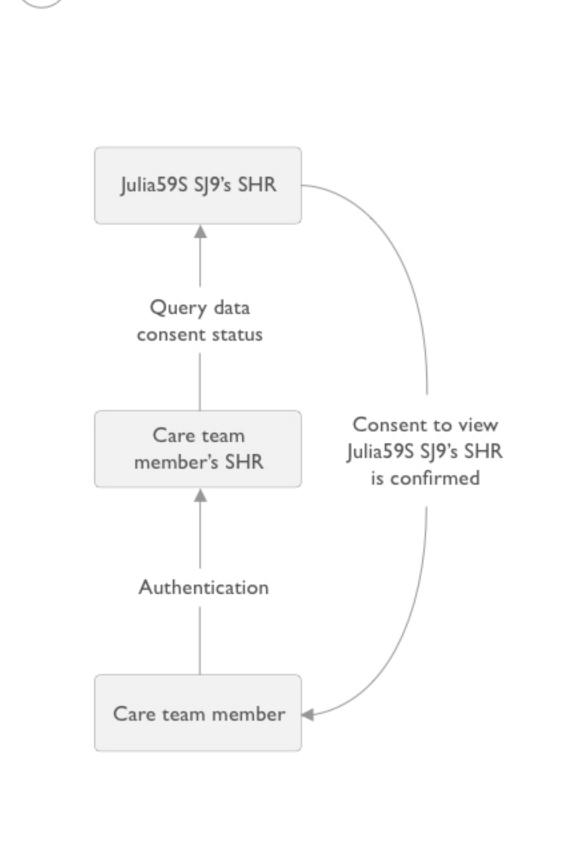

The members validate their addition to the patients

Once contacts have been validated, the patient assigns extent of view or edit options for each care team member (sections such as patient ID are able to be viewed by all, by default)

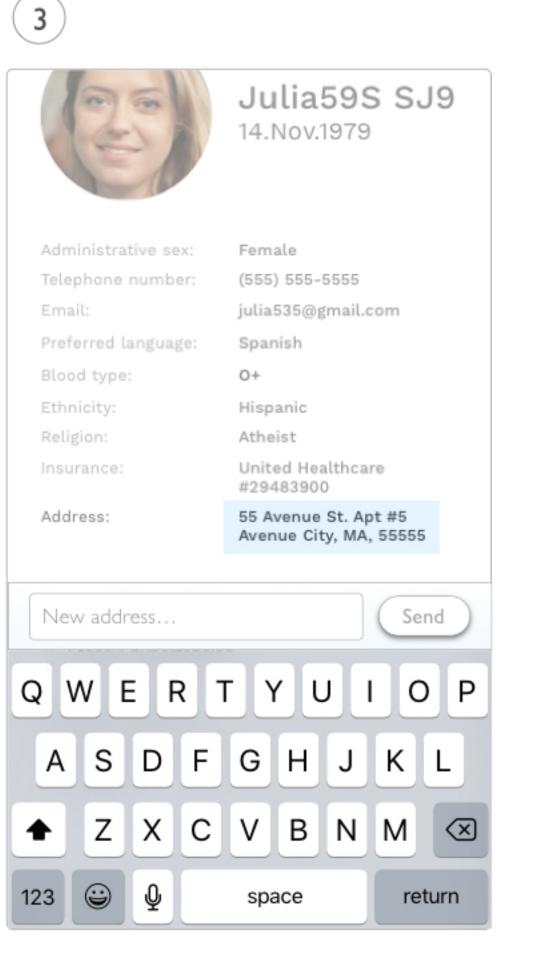

## USE CASE 2: Care team member updates basic information via SHR

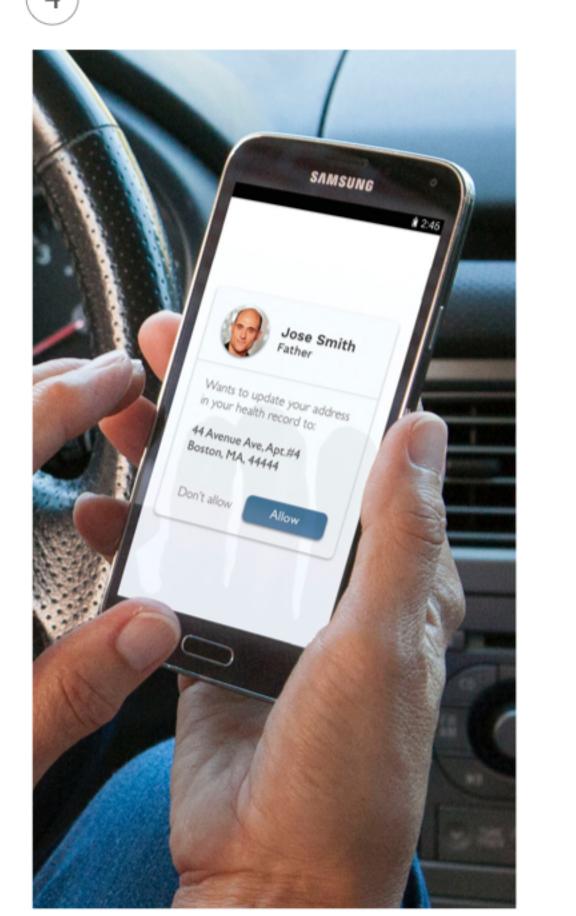

Care team member opens patient SHR

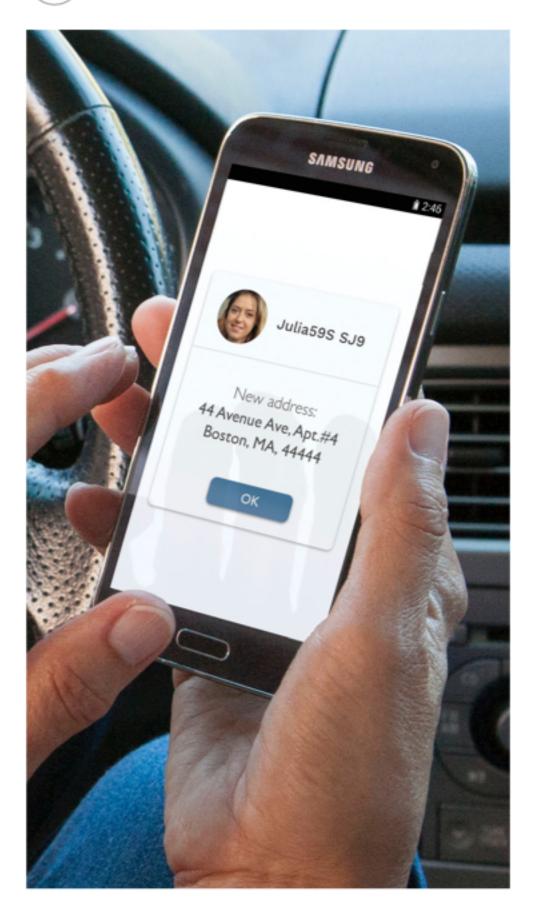

Authenticates user and returns portions of the SHR that the care team member is authorized to view/edit as determined by the patient

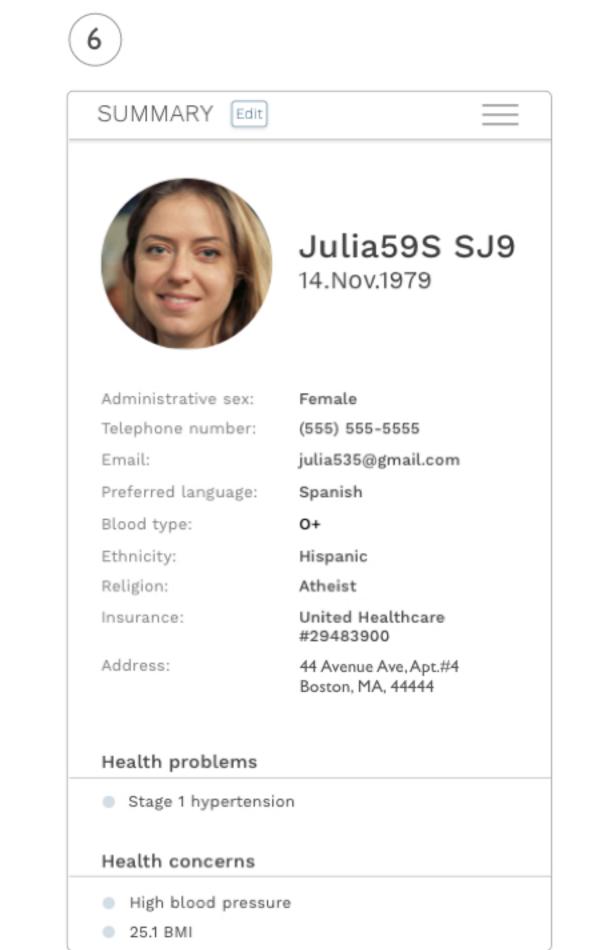

Care team member updates address information for the patient

The patient is notified of the change

The change is authorized by the patient

The SHR is updated
